The diagram illustrates the process flow between an SNMP manager (4) and a communication relay client (202). The communication relay client (202) includes a communication relay server (102), a NAT router (204), and an SNMP agent (5). The process involves the following steps:

- The SNMP manager (4) sends an SNMP request to the communication relay server (102).
- The communication relay server (102) sends a converted packet (S320) to the communication relay client (202).
- The communication relay client (202) receives the converted packet (S320) and sends a converted packet (S319) to the NAT router (204).
- The NAT router (204) sends a converted packet (S318) to the communication relay client (202).
- The communication relay client (202) receives the converted packet (S318) and sends a converted packet (S317) to the communication relay server (102).
- The communication relay server (102) receives the converted packet (S317) and sends a converted packet (S321) to the communication relay client (202).
- The communication relay client (202) receives the converted packet (S321) and sends a converted packet (S322) to the communication relay server (102).
- The communication relay server (102) receives the converted packet (S322) and sends a converted packet (S323) to the communication relay client (202).
- The communication relay client (202) receives the converted packet (S323) and sends a converted packet (S324) to the communication relay server (102).
